#### **Disclaimer**

This specification and the material contained in it, as released by AUTOSAR, is for the purpose of information only. AUTOSAR and the companies that have contributed to it shall not be liable for any use of the specification.

The material contained in this specification is protected by copyright and other types of Intellectual Property Rights. The commercial exploitation of the material contained in this specification requires a license to such Intellectual Property Rights.

This specification may be utilized or reproduced without any modification, in any form or by any means, for informational purposes only. For any other purpose, no part of the specification may be utilized or reproduced, in any form or by any means, without permission in writing from the publisher.

The AUTOSAR specifications have been developed for automotive applications only. They have neither been developed, nor tested for non-automotive applications.

The word AUTOSAR and the AUTOSAR logo are registered trademarks.

#### Advice for users

AUTOSAR specifications may contain exemplary items (exemplary reference models, "use cases", and/or references to exemplary technical solutions, devices, processes or software).

Any such exemplary items are contained in the specifications for illustration purposes only, and they themselves are not part of the AUTOSAR Standard. Neither their presence in such specifications, nor any later documentation of AUTOSAR conformance of products actually implementing such exemplary items, imply that intellectual property rights covering such exemplary items are licensed under the same rules as applicable to the AUTOSAR Standard.

## Introduction and functional overview

This specification specifies the functionality, API and the configuration of the AUTOSAR Basic Software module SOME/IP TP.

The task of the SOME/IP TP module is to segment SOME/IP packets, which do not fit into one single UDP packet. On the reception side, it re-assembles the received SOME/IP segments.

## 2 Acronyms and abbreviations

Abbreviation / Acronym:	Description:
SOME/IP	Scalable service-Oriented MiddlewarE over IP

## 3.2 Related standards and norms

[7] IEC 7498-1 The Basic Model, IEC Norm, 1994

## 3.3 Related specification

AUTOSAR provides a General Specification on Basic Software (SWS BSW General) [3] which is also valid for the SOME/IP TP module.

Thus, the specification SWS BSW General [3] shall be considered as additional and required specification for SOME/IP TP module.

## 4 Constraints and assumptions

## 4.1 Limitations

The SOME/IP TP is a simple protocol to segment SOME/IP messages. It does not implement retry mechanism nor does it reordering of received SOME/IP segments.

These limitations are intended to spare runtime and memory resources on receiver side. Nonetheless, this is a deviation from the AUTOSAR SOME/IP Protocol Specification (PRS\_SOMEIP\_00747 to PRS\_SOMEIP\_00754).

The rational for these limitations is the typical use-case which is "streaming" of large SOME/IP messages.

## 4.2 Applicability to car domains

This module is applicable for SOME/IP communication.

## **Dependencies to other modules**

## 5.1 AUTOSAR PDU Router

The SOME/IP TP module uses the PduR for both directions, the transmission path, and the reception path.

## 5.2 AUTOSAR Default Error Tracer

In order to be able to report development errors, the SOME/IP TP module has to have access to the error hook of the Default Error Tracer.

## 5.3 File structure

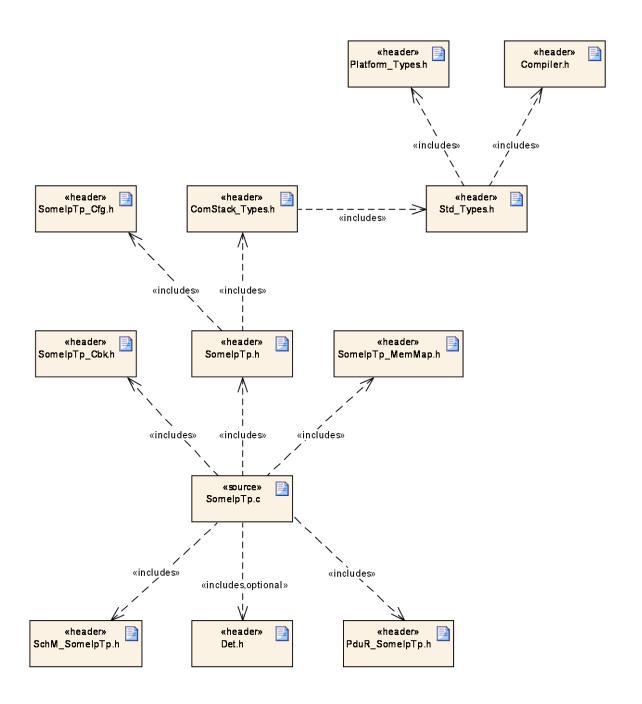

Figure 1 - File structure

## 7 Functional specification

The task of the SOME/IP TP module is to segment SOME/IP packets, which do not fit into one single UDP packet. On the reception side, it assembles the received SOME/IP segments.

The SOME/IP TP module interacts with the PDU Router for both directions, the transmission and the reception path.

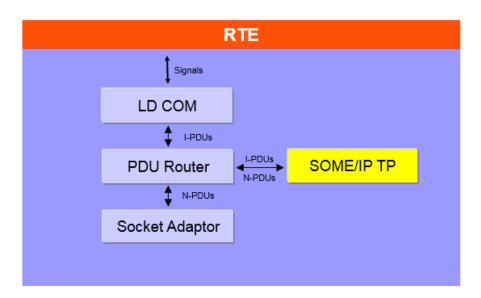

Figure 2 - Location of the SOME/IP TP module

## 7.1 Overview of the SOME/IP header

This chapter describe the relevant parts of the SOME/IP header for the segmentation of SOME/IP messages.

The Message Type field of the SOME/IP header contains a bit, which marks the SOME/IP PDU as a segment of an original SOME/IP message. Every segmented SOME/IP message adds SOME/IP TP specific fields to the SOME/IP header.

These fields contain control information for the segmentation and the reassembly of original, large SOME/IP messages. How they are used is described in the following chapters.

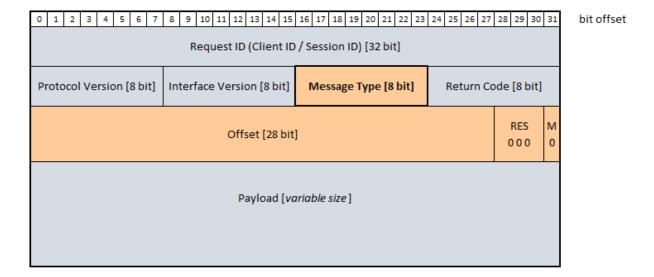

Figure 3 -SOME/IP TP header

**Note:** The Offset Field, the Reserved bits and the More Segment Flag are only present if the TP-Flag is set to '1'.

## 7.1.1 Message Type Field

The Message Type Field contains the TP-Flag, which marks this SOME/IP message as a SOME/IP segment of an original SOME/IP message.

			Mess	age 7	Гуре [	8 bit]		
bit offset	16	17	18	19	20	21	22	23
Value	Х	Х	0/1	Х	Х	Х	Х	Х
Name	ignore	ignore	TP-Flag	ignore	ignore	ignore	ignore	ignore

Figure 4 - Location of the TP-Flag

## 7.1.2 Offset Field

The Offset Field [28 bits] is located right after the Return Code field. It starts at bit offset 0, and ends at bit offset 27. The contained value increases after every transmitted/received segment according to the payload length of the previous transmitted/received SOME/IP segment.

The Offset Field contains the Offset Value in units of 16 bytes. (E.g.: If the Offset Field is set to 92, 1472 Payload bytes have been transmitted so far.) These two different terms are used in the remainder of this document.

**Note:** The payload length provided in the Offset Field does not include the bytes which are needed for the SOME/IP header.

## 7.1.3 Reserved Field

The Reserved Field [3 bits] follows the Offset Field. It starts at bit offset 28 and ends at bit offset 30. These three bits are reserved and set to 0.

## 7.1.4 More Segments Flag

The More Segments Flag [1 bit] indicates whether another segmented SOME/IP PDU will follow.

## 7.1.5 Example

An original SOME/IP message of 5880 bytes payload has to be transmitted. The Length field of this original SOME/IP message is set to 8 + 5880 bytes.

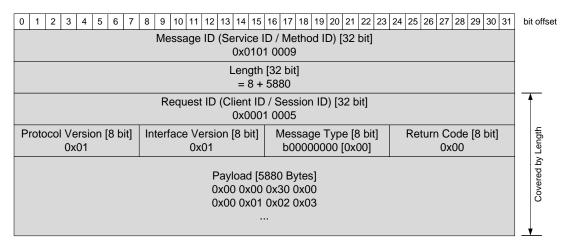

Figure 5 - Example: Header of Original SOME/IP message

This original SOME/IP message will now be segmented into 5 consecutive SOME/IP segments. Every payload of these segments carries at most 1392 bytes in this example.

For these segments, the SOME/IP TP module adds additional TP fields (marked red). The Length field of the SOME/IP carries the overall length of the SOME/IP segment including 8 bytes for the Request ID, Protocol Version, Interface Version, Message Type and Return Code. Because of the added TP fields (4 bytes), this Length information is extended by 4 additional SOME/IP TP bytes.

The following figure provides an overview of the relevant SOME/IP header settings for every SOME/IP segment:

	Length (Bytes)	Message Type [TP-Flag]	Offset Value	More Segment Flag
1 <sup>st</sup> segment	8 + 4 + 1392 = 1404	TP-Flag = '1'	0	1
	8 + 4 + 1392 = 1404		87	1
3 <sup>rd</sup> segment	8 + 4 + 1392 = 1404	TP-Flag = '1'	174	1
4 <sup>th</sup> segment	8 + 4 + 1392 = 1404	TP-Flag = '1'	261	1
5 <sup>th</sup> segment	8 + 4 + 312 = 324	TP-Flag = '1'	348	0

Figure 6 - Example: Overview of relevant SOME/IP TP headers

**Note:** Please be aware that the value provided within the Offset Field is given in units of 16 bytes, i.e.: The Offset Value of 87 correspond to 1392 bytes Payload. The complete SOME/IP headers of the SOME/IP segments message will look like this in detail:

• The first 4 segments contain 1392 Payload bytes each with "More Segments Flag" set to '1':

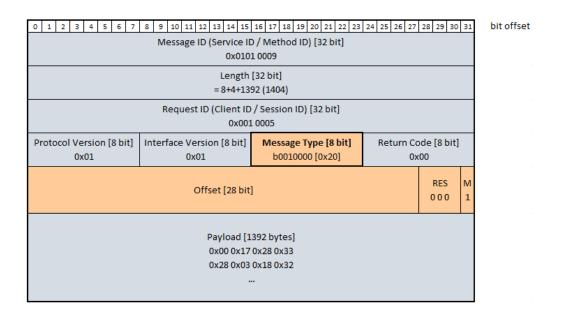

Figure 7 - Example: Header of the SOME/IP segments

 The last segment (i.e. #5) contains the remaining 312 Payload bytes of the original 5880 bytes payload. This last segment is marked with "More Segments flag" set to '0'.

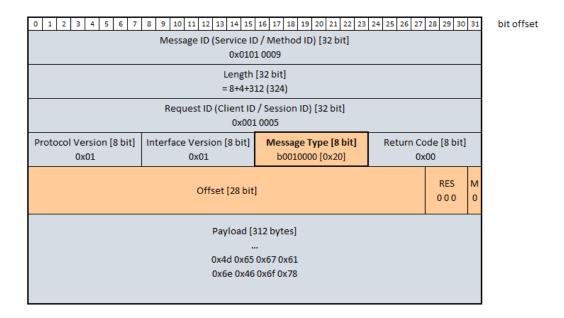

Figure 8 - Example: Header of the last SOME/IP segment

## 7.2 Segmentation of SOME/IP messages (TX Path)

The following chapter describe the necessary activities of the SOME/IP TP module to segment SOME/IP messages.

## 7.2.1 Size of SOME/IP segments

## [SWS\_SomelpTp\_00001] [

The SOME/IP TP module shall remember the PDU length separately for every PDU ID which is passed by the PduInfoPtr parameter of the SomeIpTp Transmit()

I (RS SOMEIP 00010, RS SOMEIP 00011)

## Note:

The SOME/IP TP module needs this information to calculate the payload size, the Offset Value, and the More Segments Flag for the SOME/IP segments which are going to be transmitted.

## [SWS SomelpTp 00002] [

The amount of generated SOME/IP segments shall be as little as possible. | (RS\_SOMEIP\_00011, PRS\_SOMEIP\_00735)

Note: This means that the SOME/IP TP module shall try to always use the maximum allowed segmentation size.

## [SWS\_SomelpTp\_00003] [

The size of every segmented SOME/IP message shall consist of the sum of 12 bytes of SOME/IP header, and the Payload bytes itself. | (RS\_SOMEIP\_00011)

## [SWS SomelpTp 00004] [

The SOME/IP TP module shall derive the maximum possible size of the segmented **SOME/IP PDUs using the parameter** SomeIpTpTxNPduRef. | (RS\_SOMEIP\_00011, PRS\_SOMEIP\_00735)

## [SWS SomelpTp 00005] [

The SOME/IP TP module shall generate segmented SOME/IP PDUs not larger than the size derived from the parameter SomeIpTpTxNPduRef.

I (RS SOMEIP 00011, PRS SOMEIP 00735)

## [SWS SomelpTp 00006] [

Every payload of a segmented SOME/IP message except the last one has to be a multiple of 16 bytes.

(RS SOMEIP 00011, PRS SOMEIP 00729)

## [SWS\_SomelpTp\_00007] [

The SOME/IP TP module shall buffer the pointer to the Meta-data for every PDU ID separately which is passed by the PduInfoPtr parameter of the API SomeIpTp\_Transmit(), and forward this information when PduR SomeIpTpTransmit() is called for each segment. ]()

## 7.2.2 Header of SOME/IP segments

Every generated SOME/IP header for each SOME/IP segment is set to the following values:

The following fields are received by the upper layer:

• Request ID [32 bit] derived value, see SWS SomelpTp 00007 Protocol Version [8 bit] - derived value, see SWS SomelpTp 00007 - derived value, see SWS SomelpTp 00007 • Interface Version [8 bit] Message Type [8 bit] – calculated value, see SWS\_SomelpTp\_00008 • Return Code [8 bit] - derived value, see SWS SomelpTp 00007

The following fields are added by the SOME/IP TP module:

• Offset [28 bit] - calculated value, see SWS SomelpTp 00011 • Reserved bits [3 bit] - statically set to '000', see SWS SomelpTp 00012 More Segment Flag [1 bit] – calculated value, see SWS\_SomelpTp\_00013

## [SWS SomelpTp 00008] [

The SOME/IP TP module shall store the Request ID, Protocol Version, Interface Version, Message Type, and the Return Code of the SOME/IP header for every PDU ID separately which is passed by the call of SomeIpTp Transmit(). | (RS\_SOMEIP\_00010)

#### Note:

The SOME/IP header is contained in the first 8 bytes of the total length of the original SOME/IP PDU. The total length is provided via the API call SomeIpTp Transmit().

## [SWS SomelpTp 00009] [

If the provided SDU fits into one single PDU, the provided SOME/IP header shall be used with no modification.

If the provided SDU does not fit into one single SOME/IP PDU, the SOME/IP TP module shall set the TP-Flag of the Message Type to '1' for every SOME/IP segment which is going to be sent on the bus via the PduR.

All the other bits contained in the Message Type field shall stay untouched.

I (PRS SOMEIP 00367)

## [SWS SomelpTp 00010] [

The SOME/IP TP module shall create and attach the Offset Field, the Reserved bits, and the More Segment Flag to every SOME/IP segment which is going to be sent on the bus.

| (PRS\_SOMEIP\_00723)

## [SWS\_SomelpTp\_00011] [

The Offset Field of the first SOME/IP segment shall be set to '0'. (PRS SOMEIP 00725)

## [SWS SomelpTp 00012] [

The SOME/IP TP module shall increase the value of the Offset Field for every successfully transmitted SOME/IP segment by the amount of bytes which have been transmitted by the previous SOME/IP segment divided by 16.

I (PRS SOMEIP 00725, PRS SOMEIP 00736)

## [SWS SomelpTp 00013] [

The SOME/IP TP module shall set the Reserved bits statically to '000' by the sender and shall be ignored by the receiver.

| (PRS\_SOMEIP\_00726)

## [SWS SomelpTp 00014] [

The SOME/IP TP module shall set the More Segment Flag to '1' except for the last SOME/IP segment.

| (PRS\_SOMEIP\_00727)

## [SWS SomelpTp 00015] [

The SOME/IP TP module shall set the More Segment Flag to '0' for the last SOME/IP segment.

| (PRS\_SOMEIP\_00727)

## 7.2.3 Sending of SOME/IP segments

## [SWS\_SomelpTp\_00016] [

If the API SomeIpTp Transmit() is called, the SOME/IP TP module shall check for an ongoing segmentation for the provided PDU ID. | (RS\_SOMEIP\_00010)

## [SWS\_SomelpTp\_00017] [

If the API SomeIpTp Transmit() is called while no segmentation is ongoing for this PDU ID, the SOME/IP TP module shall perform the following steps in the following order:

- Remember the provided PDU length (provided PduInfoPtr).
- Derive the PDU ID which shall be used for every segmented SOME/IP PDU (see SomeIpTpTxNPduRef).
- Calculate the size of the SOME/IP for the first segment (considering header and
- Call the API PduR SomeIpTpTransmit() using the derived PDU ID and the calculated PDU size and set the SduDataPtr to NULL PTR.

| (RS\_SOMEIP\_00010)

## [SWS SomelpTp 00018] [

When the API SomeIpTp TriggerTransmit() is called, create the header for the SOME/IP segment and call the API PduR SomeIpTpCopyTxData() using the calculated payload for this segment, and set the parameter retry to NULL PTR. I (RS SOMEIP 00010)

## [SWS SomelpTp 00019] [

To calculate the possible maximum size for all consecutive SOME/IP TP segments. the SOME/IP TP module shall consider the available buffer size of the upper layer by evaluating the availableDataPtr, provided by the API PduR SomeIpTpCopyTxData().

I.e.: The payload size of the next SOME/IP TP segment needs to be smaller or equal to the available buffer, AND dividable by 16 for all segments but for the last. | (RS\_SOMEIP\_00010, RS\_SOMEIP\_00738)

## [SWS SomelpTp 00020] [

The SOME/IP TP module shall debounce subsequent calls of the API PduR SomeIpTpTransmit() for the same PDU ID, using the parameter SomeIpTpNPduSeparationTime.

It defines the time span between the call of SomeIpTp TxConfirmation(), and the subsequent call of the API PduR SomeIpTpTransmit(). | (RS\_SOMEIP\_00010)

## [SWS SomelpTp 00021] [

If the last SOME/IP segment of the original SOME/IP PDU has been transmitted successfully (i.e. the call of SomeIpTp TxConfirmation() with parameter success equals TRUE occurred for the last call of PduR SomeIpTpCopyTxData()), the SOME/IP TP module shall

• Call the API PduR SomeIpTpTxConfirmation(). | (RS\_SOMEIP\_00010)

#### Note:

With the call of PduR SomeIpTpTxConfirmation(), the segmentation process is finished.

## 7.2.4 Interruption of the disassembly process

## [SWS\_SomelpTp\_00022] [

If the API SomeIpTp Transmit() is called with a PDU ID which is currently used for an ongoing segmentation,

- E NOT OK shall be returned.
- The ongoing disassembly process for this PDU ID shall be canceled.
- The API Det ReportRuntimeError() shall be called with the runtime error code SOMEIPTP E DISASSEMBLY INTERRUPT.

I (RS SOMEIP 00010)

## [SWS SomelpTp 00023] [

If the API SomeIpTp TxConfirmation() is called with parameter success set to FALSE,

- The disassembly process for this PDU ID shall be canceled.
- The API PduR SomeIpTpTxConfirmation() with result set to E NOT OK shall be called.
- The API Det ReportRuntimeError() shall be called with the runtime error code SOMEIPTP E DISASSEMBLY INTERRUPT.

| (RS\_SOMEIP\_00010, RS\_SOMEIP\_00738)

## [SWS SomelpTp 00024] [

If the availableDataPtr, provided by the API PduR SomeIpTpCopyTxData() is smaller than 16 bytes, or smaller than required for the last SOME/IP TP segment,

- The disassembly process for this PDU ID shall be canceled.
- The API PduR SomeIpTpTxConfirmation() with result set to E NOT OK shall be called.
- The API Det ReportRuntimeError() shall be called with the runtime error code SOMEIPTP E DISASSEMBLY INTERRUPT.

| (RS\_SOMEIP\_00010, RS\_SOMEIP\_00738)

## [SWS SomelpTp 00025] [

If an API PduR SomeIpTpCopyTxData() returns something else than BUFREQ OK,

- The disassembly process for this PDU ID shall be canceled.
- The API PduR SomeIpTpTxConfirmation() with result set to E NOT OK shall be called.
- The API Det ReportRuntimeError() shall be called with the runtime error code SOMEIPTP E DISASSEMBLY INTERRUPT.

| (RS\_SOMEIP\_00010, RS\_SOMEIP\_00738)

## 7.3 Assembly of received SOME/IP messages (RX path)

## [SWS SomelpTp 00026] [

If the API SomeIpTp RxIndication() is called, the SOME/IP TP module shall derive the following SOME/IP header information from the first 12 bytes of the received PDU:

- Request ID [32 bit]
- Protocol Version [8 bit]
- Interface Version [8 bit]
- Message Type [8 bit]
- Return Code [8 bit]
- Offset [28 bit]
- Reserved bits [3 bit]
- More Segment Flag [1 bit]

| (RS\_SOMEIP\_00010, PRS\_SOMEIP\_00723)

## [SWS SomelpTp 00027] [

The SOME/IP TP module shall be able to store the value of the Offset Field for every PDU ID separately.

| (RS\_SOMEIP\_00010)

## [SWS\_SomelpTp\_00028] [

The SOME/IP TP module shall be able to store the amount of Payload bytes for every PDU ID separately which has been passed by a call of

SomeIpTp RxIndication().

I (RS SOMEIP 00010)

## [SWS SomelpTp 00029] [

The SOME/IP TP module shall store the status of the More Segment Flag for every PDU ID separately which is passed by a call of SomeIpTP RxIndication(). | (RS\_SOMEIP\_00010)

## [SWS\_SomelpTp\_00030] [

The SOME/IP TP module shall buffer the pointer to the Meta-data for every PDU ID separately which is passed by the PduInfoPtr parameter of the API SomeIpTp RxIndication(), and forward this information when PduR SomeIpTpStartOfReception is called. | () |

## [SWS\_SomelpTp\_00031] [

If SomeIpTp RxIndication() is called with TP Flag set to '0', SOME/IP TP shall call PduR SomeIpTpStartOfReception, PduR SomeIpTpCopyRxData(), and SomeIpTp RxIndication(), directly after each other providing the received indication.

] ()

## 7.3.1 SOME/IP segment received with Offset 0

## [SWS SomelpTp 00032] [

If a SOME/IP segment is successfully received with Offset Field set to 0, the SOME/IP TP module shall store the values of the received SOME/IP header for each PDU ID separately. These values shall be used as reference values for the (expected) following consecutive receiving SOME/IP segments (i.e. with Offset Field set to > 0).

| (RS\_SOMEIP\_00010)

## [SWS\_SomelpTp 000331 [

If a SOME/IP segment is successfully received with Offset Field set to 0, the SOME/IP TP module shall

- Start the Rx timeout time defined by SomeIpTpRxTimeoutTime.
- Call the API PduR SomeIpTpStartOfReception() with the PDU ID derived from the parameter SomeIpTpRxSduRef and the TpSduLength set to '0'.

| (RS\_SOMEIP\_00010)

#### Note:

TpSduLength set to '0' indicates "unknown message length" to the upper layers.

## [SWS SomelpTp 00034] [

If a SOME/IP segment is successfully received with Offset Field set to 0 and after the SOME/IP TP module has called the API PduR SomeIpTpStartOfReception(), the SOME/IP TP module shall check the returned bufferSizePtr.

If the bufferSizePtr is greater or equal to the sum of the received payload and the added SOME/IP header, the SOME/IP TP module shall call the API PduR SomeIpTpCopyRxData() to pass the following assembled SOME/IP message. This PDU shall contain the following content:

- Request ID [32 bit]
- Protocol Version [8 bit]
- Interface Version [8 bit]
- Message Type [8 bit] see SWS\_SomelpTp\_00028
- Return Code [8 bit]
- [Payload]

| (RS\_SOMEIP\_00010)

## [SWS SomelpTp 00035]

The SOME/IP TP module shall set the TP-Flag contained in the Message Type back to '0' before the assembled SOME/IP header is passed to the upper layer. | (PRS\_SOMEIP\_00746)

## [SWS\_SomelpTp\_00036] [

The SOME/IP TP module shall store the amount of Payload bytes for every PDU ID separately which has been passed to the upper layer. ] (RS\_SOMEIP\_00010)

This information will be used to verify the Offset Value of the consecutive SOME/IP segments.

## 7.3.2 SOME/IP segment received with Offset > 0

## [SWS\_SomelpTp\_00037] [

If a SOME/IP segment is successfully received with Offset Field > 0, the SOME/IP TP module shall compare the received SOME/IP header fields with the values of the stored SOME/IP header fields which has been received with the first segment (i.e. Offset was set to 0):

- Request ID [32 bit]
- Protocol Version [8 bit]
- Interface Version [8 bit]
- Message Type [8 bit]
- Return Code [8 bit]

If these values match, continue with the assembly process. I (RS SOMEIP 00010)

## [SWS SomelpTp 00038] [

The SOME/IP TP module shall store the amount of Payload bytes for every PDU ID separately which has been passed to the upper layer. | (RS\_SOMEIP\_00010)

## [SWS SomelpTp 00039] [

The SOME/IP TP module shall compare the value of the Offset Field with the sum divided by 16 of copied Payload bytes since the first received SOME/IP segment (i.e. with Offset Field set to '0').

If this sum divided by 16 matches with the current Offset Value and if the bufferSizePtr provided by the previous call of the API

PduR SomeIpTpCopyRxData() is greater or equal to the received payload, call the API PduR SomeIpTpCopyRxData() with SduLength set to the received Payload bytes.

I (RS SOMEIP 00010)

#### Note:

In case of Offset Field value > 0, only the Payload bytes are provided to the upper layer (without any SOME/IP header fields)

## [SWS SomelpTp 00040] [

If a SOME/IP segment is successfully received with the More Segment Flag set to '0', the SOME/IP TP module shall

- Cancel the Rx timeout time defined by SomeIpTpRxTimeoutTime.
- Call the API PduR SomeIpTpRxIndication() after it has copied the remaining received Payload bytes to the upper layer (as defined in SWS\_SomelpTp\_00033).

| (RS\_SOMEIP\_00010)

## 7.3.3 Interruption of the assembly process

## ISWS SomeIpTp 000411

If the Rx timeout time defined by SomeIpTpRxTimeoutTime expires,

- The current assembly process shall be stopped.
- The API Det ReportRuntimeError() shall be called with the runtime error code SOMEIPTP E ASSEMBLY INTERRUPT.

| (RS\_SOMEIP\_00010, RS\_SOMEIP\_00738)

## [SWS\_SomelpTp\_00042] [

If the API SomeIpTp RxIndication() is called with the Offset Value is > 0 but no session is currently running.

- The received PDU shall be ignored
- The API Det ReportRuntimeError() shall be called with the runtime error code SOMEIPTP E INCONSISTENT SEQUENCE.

| (RS\_SOMEIP\_00010, PRS\_SOMEIP\_00749)

**Note:** This check identifies that at least the first segment has not been received.

## [SWS\_SomelpTp\_00054] [

If the SOME/IP TP module interrupts the assembly process because of a detected error, the SOME/IP TP module shall

- Call the API PduR SomeIpTpRxIndication() for this PDU ID with E NOT OK.
- The Rx timeout time defined by SomeIpTpRxTimeoutTime shall be canceled (if still running) for this PDU ID.

I (RS SOMEIP 00010)

Note: The possible reasons for interruptions are listed below.

## [SWS SomelpTp 00062] [

If the SOME/IP TP module detects an inconsistency of the received SOME/IP TP headers (i.e.: Request ID, Protocol Version, Interface Version, Message Type or Return Code are not equal for all received segments),

- The current assembly process shall be interrupted as defined by SWS SomelpTp 00083.
- The API Det ReportRuntimeError() shall be called with the runtime error code SOMEIPTP E INCONSISTENT HEADER.

| (RS\_SOMEIP\_00010)

## [SWS SomelpTp 00045] [

If the API SomeIpTp RxIndication() is called, the SOME/IP TP module shall check if the TP-Flag of the Message Type is set to '1'. If the TP-Flag is not set to '1'.

- The current assembly process shall be interrupted as defined by SWS SomelpTp 00083.
- The API Det ReportRuntimeError() shall be called with the runtime error code SOMEIPTP E MESSAGE TYPE.

| (RS\_SOMEIP\_00010)

## [SWS SomelpTp 00063] [

If the API SomeIpTp RxIndication() is called, the SOME/IP TP module shall check whether the received payload bytes are dividable by16 in case the More Segment Flag is set to '1'.

If the received payload bytes are not dividable by 16 in this case.

- The current assembly process shall be interrupted as defined SWS SomelpTp 00083.
- The API Det ReportRuntimeError() shall be called with the runtime error code SOMEIPTP\_E\_ASSEMBLY\_INTERRUPT.

| (RS\_SOMEIP\_00010, PRS\_SOMEIP\_00749)

## [SWS\_SomelpTp\_00064] [

If the API SomeIpTp RxIndication() is called, the SOME/IP TP module shall check the value of the Offset Field. If the Offset Value in units of 16 bytes does not match to the sum of the received Payload bytes of the previous SOME/IP segments,

- The current assembly process shall be interrupted as defined SWS SomelpTp 00083.
- The API Det ReportRuntimeError() shall be called with the runtime error code SOMEIPTP E INCONSISTENT SEQUENCE.

(RS SOMEIP 00010, PRS SOMEIP 00749)

## [SWS\_SomelpTp\_00048] [

If the API SomeIpTp RxIndication() is called, the SOME/IP TP module shall check the value of the Offset Field. If the received Offset Value equals '0' while the received Payload bytes of the previous SOME/IP segments is greater than '0', the SOME/IP TP module shall perform the following steps in the following order:

- The current assembly process shall be interrupted as defined SWS SomelpTp 00083.
- The API Det ReportRuntimeError() shall be called with the runtime error code SOMEIPTP\_E\_INCONSISTENT\_SEQUENCE.
- Start the assembly process according to chapter 7.3.1 SOME/IP segment received with Offset 0

| (RS\_SOMEIP\_00010, PRS\_SOMEIP\_00749)

## [SWS\_SomelpTp\_00049] [

If the bufferSizePtr provided by the API PduR SomeIpTpStartOfReception() or PduR SomeIpTpCopyRxData() is smaller than the sum of the received and the added SOME/IP header (in case of the first segment) or the received payload (in case of any subsequent segment),

- The current assembly process shall be interrupted as defined by SWS\_SomelpTp\_00083.
- The API Det ReportRuntimeError() shall be called with the runtime error code SOMEIPTP E ASSEMBLY INTERRUPT.

I (RS SOMEIP 00010)

## [SWS SomelpTp 00050] [

If the API PduR SomeIpTpCopyRxData() returns something else than BUFREQ OK.

- The assembly process for this PDU ID shall be interrupted as defined by SWS SomelpTp 00083.
- The API Det ReportRuntimeError() shall be called with the runtime error code SOMEIPTP E ASSEMBLY INTERRUPT.

I (RS SOMEIP 00010, RS SOMEIP 00738)

## [SWS SomelpTp 00051] [

If the API PduR SomeIpTpStartOfReception() returns something else than BUFREQ OK,

- The assembly process for this PDU ID shall be stopped.
- The API Det ReportRuntimeError() shall be called with the runtime error code SOMEIPTP E ASSEMBLY INTERRUPT.

I (RS SOMEIP 00010, RS SOMEIP 00738)

## 7.4 Error classification

## 7.4.1 Development Errors

The following Development Errors can be detected by the SOME/IP TP module

## [SWS\_SomelpTp\_00052] [ Development Error Types

Type of error	Related error code	Value [hex]
SOME/IP TP module not initialized	SOMEIPTP_E_NOTINIT	0x01
Null pointer has been passed as an argument	SOMEIPTP_E_PARAM_POINTER	0x02
Unknown parameter has been passed	SOMEIPTP_E_PARAM	0x03

1()

## 7.4.2 Runtime Errors

## [SWS\_SomelpTp\_00065] Runtime Error Types

Type of error	Related error code	Value
		[hex]
The TP-Flag (of Message Type) was set to ,0'	SOMEIPTP_E_MESSAGE_TYPE	0x04
Inconsistent subsequent segment received	SOMEIPTP_E_INCONSISTENT_SEQUENCE	0x05
Inconsistent header received	SOMEIPTP_E_INCONSISTENT_HEADER	0x06
Disassembly Interrupt due to the upper layer	SOMEIPTP_E_DISASSEMBLY_INTERRUPT	0x07
Assembly Interrupt due to the upper layer	SOMEIPTP_E_ASSEMBLY_INTERRUPT	80x0

]()

## 7.4.3 Transient Faults

There are no extended production errors.

## 7.4.4 Production Errors

There are no production errors.

## 7.4.5 Extended Production Errors

There are no extended production errors.

## 8 API specification

## 8.1 Imported types

In this chapter all types included from the following files are listed:

[SWS SomelpTp 00043] [

[a 11 a _a a 11 a 1 b 1 b _a a a 1 a ]		
Module	Imported Type	
ComStack_Types	BufReq_ReturnType	
	PduldType	
	PduInfoType	
	PduLengthType	
	RetryInfoType	
Std_Types	Std_ReturnType	
	Std_VersionInfoType	

(SRS\_BSW\_00301)

## 8.2 Type definitions

[SWS\_SomelpTp\_91002] [

Name:	SomeIpTp_ConfigType		
Туре:	Structure		
Range:	implementation specific		
•	This type shall contain at least all parameters that are post-build able according to chapter 10.		

] ()

## 8.3 Function definitions

## 8.3.1 SomelpTp\_GetVersionInfo

[SWS\_SomelpTp\_00044] [

Service name:	SomeIpTp_GetVersionInfo				
Syntax:	<pre>void SomeIpTp_GetVersionInfo(     Std_VersionInfoType* VersionInfo )</pre>				
Service ID[hex]:	0x01				
Sync/Async:	Synchronous				
Reentrancy:	Reentrant				
Parameters (in):	None				
Parameters (inout):	None				
Parameters (out):	VersionInfo Pointer to where to store the version information of this module.				
Return value:	None				
Description:	Returns the version information of this module.				

(SRS BSW 00407,SRS BSW 00411)

## [SWS\_SomelpTp\_00066] [

If the parameter SomeIpTp\_VersionInfoPtr of the API

SomeIpTp GetVersionInfo() equals NULL\_PTR and if development error detection is enabled (i.e. SomeIpTpDevErrorDetect is set to TRUE), the function SomeIpTp GetVersionInfo, the API Det ReportError() shall be called with the development error code SOMEIPTP E PARAM POINTER. 10

## 8.3.2 SomelpTp\_Init

[SWS\_SomelpTp\_00046] [

Service name:	SomeIpTp_Init		
Syntax:	<pre>void SomeIpTp_Init(      const SomeIpTp_ConfigType* config )</pre>		
Service ID[hex]:	0x02		
Sync/Async:	Synchronous		
Reentrancy:	Non Reentrant		
Parameters (in):	config Base pointer to the configuration structure of the SOME/IP TP module.		
Parameters (inout):	None		
Parameters (out):	None		
Return value:	None		
Description:	Initializes the SOME/IP TP module.		

(SRS\_BSW\_00407,SRS\_BSW\_00411)

#### Note:

The AUTOSAR ECU StateManager calls this SOME/IP TP API service with the address of the static configuration structure of the module in parameter SomeIpTp\_ConfigPtr.

## 8.3.3 SomelpTp\_Transmit

[SWS\_SomelpTp\_00047] [

Service name:	SomelpTp_Transmit		
Syntax:	Std_ReturnType SomeIpTp_Transmit(     PduIdType TxPduId,     const PduInfoType* PduInfoPtr )		
Service ID[hex]:	0x49		
Sync/Async:	Synchronous		
Reentrancy:	Reentrant for different Pdulds. Non reentrant for the same Pduld.		
Parameters (in):	TxPduld	Identifier of the PDU to be transmitted	
	PduInfoPtr	Length of and pointer to the PDU data and pointer to MetaData.	
Parameters (inout):	None		
Parameters (out):	None		
Return value:		E_OK: Transmit request has been accepted. E_NOT_OK: Transmit request has not been accepted.	
Description:	Requests transmission of a PDU.		

] ()

### [SWS\_SomelpTp\_00052] [

If SomeIpTp Transmit() is called before the SOME/IP TP module has been initialized with a call of SomeIpTp Init(), the AP shall return with E\_NOT\_OK and stop the new session. I()

#### [SWS\_SomelpTp\_00048] [

If development error detection is enabled: SomeIpTp Transmit() shall check that the service SomeIpTp Init() was previously called. If the check fails, SomeIpTp Transmit() shall raise the development error SOMEIPTP E NOTINIT. | () |

### [SWS SomelpTp 00049] [

If parameter TxPduId of SomeIpTp Transmit() has an invalid value and if development error detection is enabled (i.e. SomeIpTpDevErrorDetect is set to TRUE), the API Det ReportError() shall be called with the development error code SOMEIPTP\_E\_PARAM. I()

### [SWS SomelpTp 00050] [

If parameter PduInfoPtr of SomeIpTp Transmit() equals NULL\_PTR and if development error detection is enabled (i.e. SomeIpTpDevErrorDetect is set to TRUE), the API Det ReportError() shall be called with the development error code SOMEIPTP\_E\_PARAM\_POINTER. I()

### 8.4 Call-back notifications

#### 8.4.1 SomelpTp\_TriggerTransmit

[SWS SomelpTp 00053] [

[ <u>3w3_30meib1</u>	<u></u>			
Service name:	SomelpTp_TriggerTransmit			
Syntax:	<pre>Std_ReturnType SomeIpTp_TriggerTransmit(     PduIdType TxPduId,     PduInfoType* PduInfoPtr )</pre>			
Service ID[hex]:	0x41	0x41		
Sync/Async:	Synchronous	Synchronous		
Reentrancy:	Reentrant for diff	ferent Pdulds. Non reentrant for the same Pduld.		
Parameters (in):	TxPduld	ID of the SDU that is requested to be transmitted.		
Parameters (inout):	PduInfoPtr	Contains a pointer to a buffer (SduDataPtr) to where the SDU data shall be copied, and the available buffer size in SduLengh. On return, the service will indicate the length of the copied SDU data in SduLength.		
Parameters (out):	None			
Return value:	Std_ReturnType	E_OK: SDU has been copied and SduLength indicates the number of copied bytes. E_NOT_OK: No SDU data has been copied. PduInfoPtr must not be used since it may contain a NULL pointer or point to invalid data.		
Description:	Within this API, the upper layer module (called module) shall check whether the available data fits into the buffer size reported by PduInfoPtr->SduLength. If it fits, it shall copy its data into the buffer provided by PduInfoPtr->SduDataPtr and update the length of the actual copied data in PduInfoPtr->SduLength. If not, it returns E_NOT_OK without changing PduInfoPtr.			

] ()

#### [SWS SomelpTp 00054]

If development error detection is enabled: SomeIpTp TriggerTransmit() shall check that the service SomeIpTp Init() was previously called. If the check fails, SomeIpTp Transmit() shall raise the development error SOMEIPTP\_E\_NOTINIT. 1()

[SWS\_ SomelpTp\_00055] [In case the given PduInfoPtr->SduLength is smaller than the actual PDU-length, SomeIpTp TriggerTransmit() shall not copy any data and return E\_NOT\_OK. ] ()

### 8.4.2 SomelpTp\_RxIndication

[SWS\_SomelpTp\_00056] [

Service name:	SomelpTp_RxIndication
Syntax:	<pre>void SomeIpTp_RxIndication(     PduIdType RxPduId,     const PduInfoType* PduInfoPtr )</pre>
Service ID[hex]:	0x42
Sync/Async:	Synchronous
Reentrancy:	Reentrant for different Pdulds. Non reentrant for the same Pduld.
Parameters (in):	RxPduId ID of the received PDU.  PduInfoPtr Contains the length (SduLength) of the received PDU, a pointer to a buffer (SduDataPtr) containing the PDU, and the MetaData related to this PDU.
Parameters (inout):	None
Parameters (out):	None
Return value:	None
Description:	Indication of a received PDU from a lower layer communication interface module.

1 ()

### [SWS\_SomelpTp\_00057] [

If development error detection is enabled: SomeIpTp RxIndication() shall check that the service SomeIpTp Init() was previously called. If the check fails, SomeIpTp RxIndication() shall raise the development error SOMEIPTP\_E\_NOTINIT. ]()

### 8.4.3 SomelpTp\_TxConfirmation

[SWS\_SomelpTp\_91001] [

SomeIpTp_TxConfirmation			
void SomeIpTp_TxConfirmation(			
PduIdType TxPduId,			
Std_Ret	urnType result		
)	)		
0x40			
Synchronous			
Reentrant for different Pdulds. Non reentrant for the same Pduld.			
TxPduld	ID of the PDU that has been transmitted.		
result	E_OK: The PDU was transmitted.		
	E_NOT_OK: Transmission of the PDU failed.		
None			
None			
None			
The lower layer communication interface module confirms the transmission of a			
PDU, or the failure to transmit a PDU.			
	void SomeIp PduIdTy Std_Ret )  0x40  Synchronous Reentrant for of TxPduId result  None  None  The lower laye		

] ()

### [SWS\_SomelpTp\_00067] [

If development error detection is enabled: SomeIpTp TxConfirmation() shall check that the service SomeIpTp Init() was previously called. If the check fails, SomeIpTp TxConfirmation() shall raise the development error SOMEIPTP\_E\_NOTINIT. ]()

#### 8.5 Scheduled functions

### 8.5.1 SomelpTp\_MainFunctionTx

[SWS\_SomelpTp\_00058] [

Service name:	SomeIpTp_MainFunctionTx	
Syntax:	void SomeIpTp_MainFunctionTx(	
	void	
	)	
Service ID[hex]:	0x03	
	This function performs the processing of the AUTOSAR SOME/IP TP module's transmission activities.	

(SRS\_BSW\_00373, SRS\_BSW\_00425)

[SWS\_SomelpTp\_00059] [A call to SomeIpTp MainFunctionTx() shall simply return if the AUTOSAR SOME/IP TP module was not previously initialized with a call to SomeIpTp Init(). | (SRS\_BSW\_00425)

#### 8.5.2 SomelpTp MainFunctionRx

[SWS\_SomelpTp\_00069] [

Service name:	SomeIpTp_MainFunctionRx	
Syntax:	void SomeIpTp_MainFunctionRx(	
	void	
	)	
Service ID[hex]:	0x04	
Description:	This function performs the processing of the AUTOSAR SOME/IP TP module's	
	reception activities.	

(SRS\_BSW\_00373, SRS\_BSW\_00425)

[SWS\_SomelpTp\_00070] [A call to SomeIpTp MainFunctionRx() shall simply return if the AUTOSAR SOME/IP TP module was not previously initialized with a call to SomeIpTp Init(). | (SRS\_BSW\_00425)

### 8.6 Expected Interfaces

In this chapter all external interfaces required from other modules are listed.

#### 8.6.1 Mandatory Interfaces

This chapter defines all external interfaces which are required to fulfill the core functionality of the module.

ISWS SomeIpTp 000601

[ <u>3443_30[[eib]b_00000]</u>			
API function	Description		
Det_ReportRuntimeError	Service to report runtime errors. If a callout has been configured then this callout shall be called.		
PduR_SomelpTpCopyRxData	This function is called to provide the received data of an I-PDU segment (N-PDU) to the upper layer.  Each call to this function provides the next part of the I-PDU data.  The size of the remaining data is written to the position indicated by bufferSizePtr.		
PduR_SomelpTpCopyTxData	This function is called to acquire the transmit data of an I-PDU segment (N-PDU).  Each call to this function provides the next part of the I-PDU data unless retry->TpDataState is TP_DATARETRY. In this case the function restarts to copy the data beginning at the offset from the current position indicated by retry->TxTpDataCnt. The size of the remaining data is written to the position indicated by availableDataPtr.		
PduR_SomelpTpRxIndication	Called after an I-PDU has been received via the TP API, the result indicates whether the transmission was successful or not.		
PduR_SomeIpTpStartOfReception	This function is called at the start of receiving an N-SDU. The N-SDU might be fragmented into multiple N-PDUs (FF with one or more following CFs) or might consist of a single N-PDU (SF). The service shall provide the currently available maximum buffer size when invoked with TpSduLength equal to 0.		
PduR_SomelpTpTransmit	Requests transmission of a PDU.		
PduR_SomelpTpTxConfirmation	This function is called after the I-PDU has been transmitted on its network, the result indicates whether the transmission was successful or not.		

[(SRS\_BSW\_00384)

#### 8.6.2 Optional Interfaces

This chapter defines all external interfaces which are required to fulfill an optional functionality of the module.

[SWS\_SomelpTp\_00061] [

API function	Description
Det_ReportError	Service to report development errors.

| (SRS\_BSW\_00384)

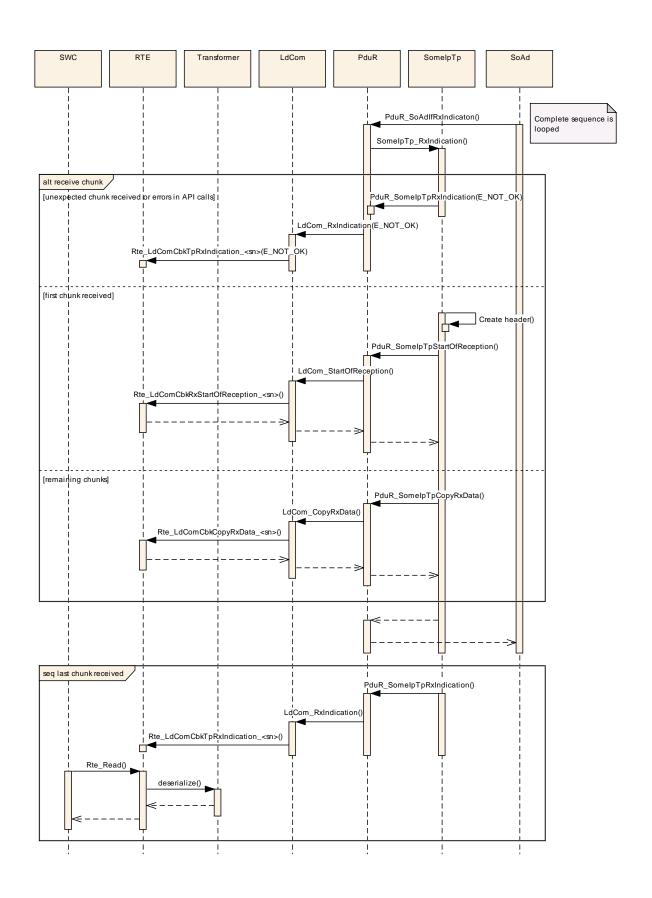

### 8.6.3 Configurable interfaces

N/A

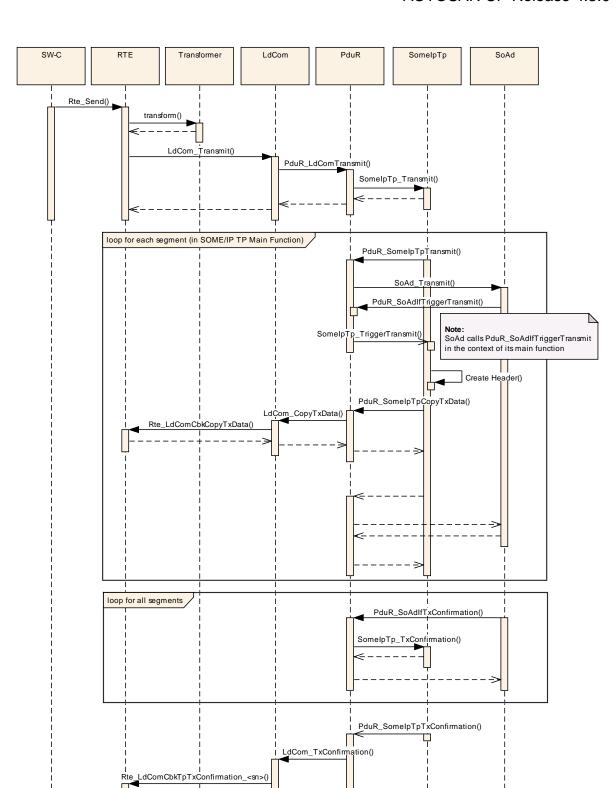

- 9 Sequence diagrams
- 9.1 Reception

Sequence 9-1 Reception of SOME/IP segments

### 9.2 Transmission

Sequence 9-2 Transmission of SOME/IP segments

# 10 Configuration specification

Chapter 10.1 specifies the structure (containers) and the parameters of the module SOME/IP TP.

Chapter 10.2 specifies additionally published information of the module SOME/IP TP.

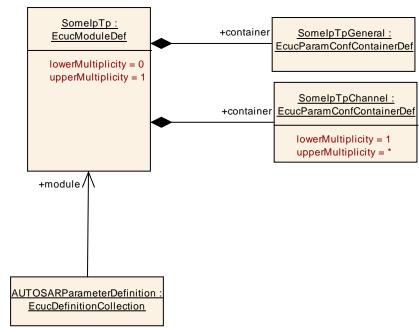

### 10.1 Containers and configuration parameters

The following chapters summarize all configuration parameters. The detailed meanings of the parameters describe Chapters 7 and Chapter 8.

### 10.1.1 SomelpTp

SWS Item	ECUC_SomelpTp_00001:
Module Name	SomelpTp
Module Description	Configuration of the SomelpTp module.
Post-Build Variant Support	true
Supported Config Variants	VARIANT-LINK-TIME, VARIANT-POST-BUILD, VARIANT-PRE-COMPILE

Included Containers		
Container Name	Multiplicity	Scope / Dependency
SomelpTpChannel	1 1 "	This container contains the configuration parameters of the SomelpTp channel.
SomelpTpGeneral		This container contains the general configuration parameters of the SomelpTp module.

(from ECUCParameterDefinitions)

### 10.1.2 SomelpTpGeneral

SWS Item	ECUC_SomelpTp_00002:
Container Name	SomelpTpGeneral
II Jescrintion	This container contains the general configuration parameters of the SomelpTp module.
Configuration Parameters	

SWS Item	ECUC_SomelpTp_00004 :			
Name	SomelpTpDevErrorDetect			
Description	Switches the Development E	Switches the Development Error Detection and Notification ON or OFF.		
Multiplicity	1			
Туре	EcucBooleanParamDef			
Default value				
Post-Build Variant Value	false			
Value Configuration Class	Pre-compile time	Χ	All Variants	
	Link time			
	Post-build time			
Scope / Dependency	scope: local	•		

SWS Item	ECUC_SomelpTp_00021 :		
Name	SomeIpTpRxMainFunctionPeriod		
Description	This parameter defines the cycle time in seconds of the periodic call of the SomelpTp_MainFunctionRx.		
Multiplicity	1		
Туре	EcucFloatParamDef		
Range	]0 INF[		
Default value			
Post-Build Variant Value	false		

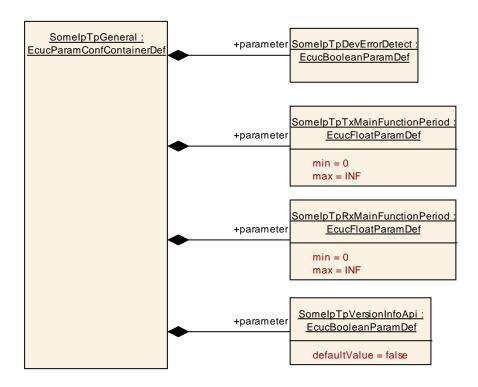

Value Configuration Class	Pre-compile time	Χ	All Variants

	Post-build time	Χ	VARIANT-POST-BUILD	
Scope / Dependency	scope: local			

SWS Item	ECUC_SomelpTp_00023:
Name	SomeIpTpRxTimeoutTime

Description	Timer to monitor the successful reception. It is started when the first NPdu is received, and is stopped when the last NPdu has been received.		
Multiplicity	1		
Туре	EcucFloatParamDef		
Range	]0 INF[		
Default value			
Post-Build Variant Value	true		
Value Configuration Class	Pre-compile time	Χ	VARIANT-PRE-COMPILE
	Link time	Χ	VARIANT-LINK-TIME
	Post-build time	Χ	VARIANT-POST-BUILD
Scope / Dependency	scope: local		

Included Containers		
Container Name	Multiplicity	Scope / Dependency
SomeIpTpRxNSdu	0*	The following parameters needs to be configured for each N-SDU which has to be passed as one assembled RxPdu to the upper layer.
SomelpTpTxNSdu	0*	The following parameters needs to be configured for each N-SDU that the SomelpTp module transmits via the SomelpTpChannel.

### 10.1.4 SomelpTpRxNSdu

SWS Item	ECUC_SomelpTp_00008:		
Container Name	SomelpTpRxNSdu		
Description	The following parameters needs to be configured for each N-SDU which has to be passed as one assembled RxPdu to the upper layer.		
Post-Build Variant Multiplicity	true		
Multiplicity Configuration	Pre-compile time X VARIANT-PRE-COMPILE		
Class	Link time	Χ	VARIANT-LINK-TIME
	Post-build time	Χ	VARIANT-POST-BUILD
Configuration Parameters			

SWS Item	ECUC_SomelpTp_00010:			
Name	SomelpTpRxSduRef			
Description	Reference to a Pdu in the Co	Reference to a Pdu in the COM-Stack that represents the assembled		
	RxPdu which is passed via t	he Pd	uR to the upper layer.	
Multiplicity	1			
Туре	Reference to [ Pdu ]	Reference to [ Pdu ]		
Post-Build Variant Value	true	true		
Value Configuration Class	Pre-compile time	Pre-compile time X VARIANT-PRE-COMPILE		
	Link time	Χ	VARIANT-LINK-TIME	
	Post-build time	Χ	VARIANT-POST-BUILD	
Scope / Dependency				

Included Containers		
Container Name	Multiplicity	Scope / Dependency
SomeIpTpRxNPdu	1	This container contains the configuration parameters of the NPdu that is received from a lower layer

### 10.1.5 SomelpTpRxNPdu

SWS Item	ECUC_SomelpTp_00011 :
Container Name	SomelpTpRxNPdu
II IASCRINTIAN	This container contains the configuration parameters of the NPdu that is received from a lower layer
Configuration Parameters	

SWS Item	ECUC_SomelpTp_00013:			
Name	SomelpTpRxNPduHandleId			
Description	This parameter defines the handle ID that is used by the PduR when calling SomeIpTp_RxIndication.			
Multiplicity	1			
Type	EcucIntegerParamDef (Symbolic Name generated for this parameter)			
Range	0 65535			
Default value				
Post-Build Variant Value	false			
Value Configuration Class	Pre-compile time	Х	All Variants	
	Link time			
	Post-build time			
Scope / Dependency	scope: local			

SWS Item	ECUC_SomeIpTp_00012 :		
Name	SomelpTpRxNPduRef		
Description	Reference to a global Pdu that is used to harmonize HandleIDs in the COM-Stack.		
Multiplicity	1		
Туре	Reference to [ Pdu ]		
Post-Build Variant Value	true		
Value Configuration Class	Pre-compile time X VARIANT-PRE-COMPILE		
	Link time	Χ	VARIANT-LINK-TIME
	Post-build time X VARIANT-POST-BUILD		
Scope / Dependency		·

# 10.1.6 SomelpTpTxNSdu

SWS Item	ECUC_SomelpTp_00009:		
Container Name	SomelpTpTxNSdu		
Description	The following parameters needs to be configured for each N-SDU that the SomeIpTp module transmits via the SomeIpTpChannel.		
Post-Build Variant Multiplicity	true		
Multiplicity Configuration	Pre-compile time	Χ	VARIANT-PRE-COMPILE
Class	Link time	Χ	VARIANT-LINK-TIME
	Post-build time	Χ	VARIANT-POST-BUILD

### **Configuration Parameters**

SWS Item	ECUC_SomeIpTp_00020 :		
Name	SomelpTpTxNSduHandleId		
Description	This parameter defines the handle ID of the NSdu that represents the original TxSdu which is segmented and passed via the PduR to the lower layer. This handle ID is used by PduR when calling SomelpTp_Transmit.		
Multiplicity	01		
Туре	EcucIntegerParamDef (Symbolic Name generated for this parameter)		
Range	0 65535		
Default value			
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	Χ	All Variants
	Link time		
	Post-build time		
Scope / Dependency	scope: local		

SWS Item	ECUC_SomelpTp_00015 :		
Name	SomelpTpTxNSduRef		
Description	Reference to a global Pdu in the COM-Stack that represents the original TxSdu which is segmented and passed via the PduR to the lower layer.		
Multiplicity	1		
Туре	Reference to [ Pdu ]		
Post-Build Variant Value	true		
Value Configuration Class	Pre-compile time	Χ	VARIANT-PRE-COMPILE
	Link time	Χ	VARIANT-LINK-TIME
	Post-build time X VARIANT-POST-BUILD		
Scope / Dependency			

Included Containers		
Container Name	Multiplicity	Scope / Dependency
SomeIpTpTxNPdu		This container contains the configuration parameters of the segmented Tx NPdus that are transmitted to a lower layer.

### 10.1.7 SomelpTpTxNPdu

SWS Item	ECUC_SomelpTp_00016 :
Container Name	SomelpTpTxNPdu
II IASCRINTIAN	This container contains the configuration parameters of the segmented Tx NPdus that are transmitted to a lower layer.
Configuration Parameters	

SWS Item	ECUC_SomelpTp_00017:		
Name	SomelpTpTxNPduHandleId		
Description	This parameter defines the handle ID that is used by PduR when calling SomeIpTp_TriggerTransmit.		
Multiplicity	01		
Туре	EcucIntegerParamDef (Symbolic Name generated for this parameter)		
Range	0 65535		
Default value			
Post-Build Variant Value	false		

## AUTOSAR CP Release 4.3.0

Value Configuration Class	Pre-compile time	Χ	All Variants
	Link time	I	
	Post-build time		
Scope / Dependency	scope: local		

SWS Item	ECUC_SomeIpTp_00018:			
Name	SomelpTpTxNPduRef	SomelpTpTxNPduRef		
Description	Reference to a global Pdu that is used to harmonize HandleIDs in the COM-Stack.			
Multiplicity	1	1		
Туре	Reference to [ Pdu ]			
Post-Build Variant Value	true			
Value Configuration Class	Pre-compile time	Χ	VARIANT-PRE-COMPILE	
	Link time	Χ	VARIANT-LINK-TIME	
	Post-build time X VARIANT-POST-BUILD			
Scope / Dependency
